Department

ACKNOWLEDGEMENT

I would like to thank God for helping me in making everything possible under His Holy Providence.

My thanks also go to all the lecturers of the English Department of Widya Mandala University, who have patiently taught me during my study in this Department.

As it is always true, a paper is not solely the result of individual effort. My deepest sincere and cordial gratitude to Dr. Wuri Soedjatmiko and Dra. Florensia Jap, my first and second advisors, for their patient guidance and valuable suggestion in the process of accomplishing this thesis. Their words of encouragement and understanding were very valuable in time of difficulties.

I should also thank the principal of SMA Stella Maris, Petrus Ratidjo; the vice principal of SMA Stella Maris, A.P. Muryanto S; the English teacher of the first year, F.M. Megawati Liesman and F.X. Totok Setyo Wahyudi, for helping me provide subjects for my study.

My thanks also goes to Drs. I Nyoman Arcana for his guidance and assistance in improving the statistical computation in this thesis.

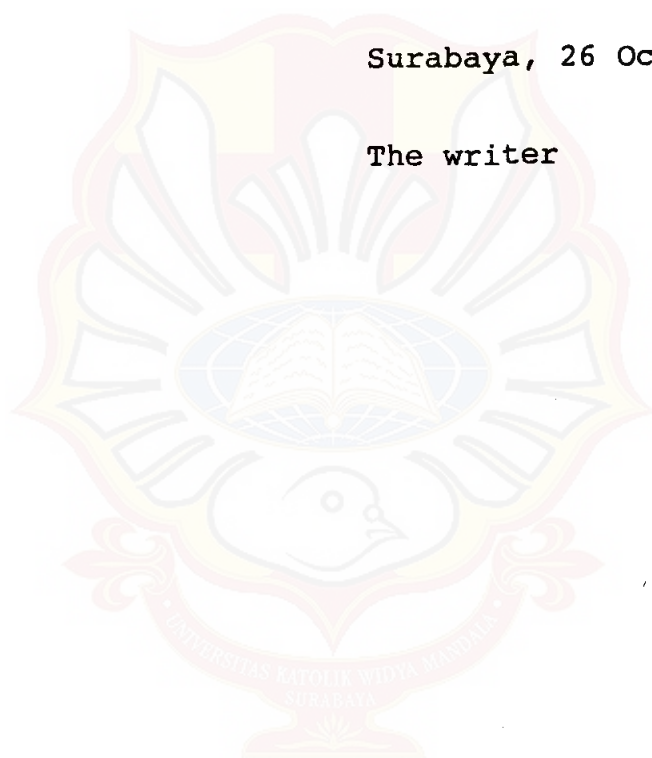

At last I would also show my thankfulness to my

husband, Johannes Tjandra Kusuma for his support and ideas in the process of accomplishing this thesis, and to my sister, Swandayani D. Suseno, BSc., for her help in making the tables in this thesis.

Without their kind help, I am sure that this thesis would not appear in its present form.

Surabaya, 26 October 1989

The writer

ABSTRACT

Reading Comprehension involves both lexical and grammatical aspects. I believe that in order to comprehend a reading passage well, one should have a wide range of vocabulary (=lexical aspect) and good knowledge of structure (=grammatical aspect), also a adequate general knowledge.

Interested in finding out whether there is a positive correlation between the students' structure, vocabulary and general knowledge achievements and their reading comprehension achievement, I decided to make a study on structure, vocabulary, general knowledge, and reading comprehension achievements of the first year students of SMA Stella Maris to see whether they really correspond to each other.

The study in this paper makes use of one part of the statistical methodology of research that is the Correlation Analysis, which analyses the data to find out the degree of the relationship between the structure achievement and the reading comprehension achievement, between the vocabulary achievement and the reading comprehension achievement, and between the general knowledge and the reading comprehension achievement.

To obtain the data in the form of scores, first I made test items on structure, vocabulary, general knowledge, and reading comprehension. The total number of the test items is 70 items, which are all in the form of multiple-choice items. After computing the entire tests using Kuder-Richardson Formula 21 (KR 21), I found out that the reliability coefficient of the structure test is 0.71, the reliability coefficient of the vocabulary test is 0.73, the reliability coefficient of the general knowledge test is 0.71, and the reliability coefficient of the reading comprehension test is 0.74. These figures show that all the four test may be regarded satisfactory.

To know the degree of the relationship, I use the Pearson Product Moment Correlation to obtain the correlation coefficient. The correlation coefficient tells us two things: the indication of the magnitude of the relationship, and the direction of the relationship. When two sets of variables are positively related, the increase of one variable is followed by the increase of the other variable. On the other hand, when they are negatively related, the increase of one variable is followed by the decrease of the other

variable. After all scores are computed using the Pearson Product Moment Correlation Formula, it can be seen that the correlation coefficient of the structure and reading comprehension achievement is 0.81; the correlation coefficient of the vocabulary and reading comprehension achievement is 0.77; and the correlation coefficient of the general knowledge and reading comprehension achievement is 0.79. This means that there is a significant correlation between the structure, the vocabulary, and the general knowledge achievements of the first year students of SMA Stella Maris and their reading comprehension achievement.
